

METOS UK will introduce a new turf management and business performance solution for golf courses at BTME.

New for 2025, the METOS UK portfolio will include an end-to-end solution including Punctus course management software, GIS mapping for precise water management, Pessl sensors for environmental monitoring, and integrations for advanced robotic solutions such as Kress mowers.

Combined, these solutions bring compound improvements in turf care, course management, sustainability, and business profitability, through:

- Improving turf health and maintenance efficiency
- Reducing chemical usage and environmental impact
- Remotely monitoring and optimising irrigation and energy use
- Effectively managing people and machinery
- Enhancing data-driven decision-making across the business

Punctus is the market leader in cloud-based greenkeeping software in Germany, Austria, and Switzerland and is now available to UK golf courses exclusively through METOS UK.

Course managers will benefit from improved data-driven decision making related to: water usage, fertilisation, turf management, and overall course maintenance through predictive analytics for weather conditions, real-time environmental monitoring, customisable alerts for irrigation or maintenance tasks, and integration with precision equipment such as Kress robotic mowers.

Integrated Pessl sensors provide real-time environmental and soil moisture data that can be tracked over time, and a new GIS mapping tool provides a visual representation of drainage and water use across the course, which can help improve course management, irrigation planning, and improvements.
